

Contaminated Water Spills From Reactor

PORT CLINTON, Ohio (AP) — About 2,000 gallons of contaminated water spilled from a nuclear reactor at the Davis-Besse power plant after a power loss triggered a surge of water in the shut down reactor's cooling system, officials said yesterday.

Some contaminated water splashed on the pants of a worker and 40 to 60 other workers were evacuated because a ventilation system was knocked out by the power failure, and heat exhaustion was feared, a company spokesman said.

The reactor was not operating during the weekend accident, and no radiation escaped from the plant, said Roger Buehrer, public information officer for Toledo Edison Co.

The Nuclear Regulatory Commission sent two more inspectors to the north-central Ohio plant after the accident. Jan Strasma, an NRC spokesman, said a breakdown at a shut down facility was "unusual, nigh unto unique."

The accident occurred Saturday during maintenance, officials said.

Jeffrey Michlowe

As you are aware, I am doing a personal, private experiment, utilizing the Egyptian Power, UFO Power, plus my own formidable psi-force powers... to attack all forms of power on a world-wide basis.

I do believe that this newspaper (and see all the like newspapers I've sent to you) spells out the effectiveness of my attacks! Have you

have an admitted anomaly called "unique" by an expert... whereby the power was knocked out in the nuclear facility even though it was shut down!

How many of my demonstrations have been called "one of a kind" or "impossible" or "the worst within a century" and so on?

From where I am watching... it is frightening!
